

ABSTRACT

A matting system for framing, archiving and displaying display items having a display board with window openings, a carrier board with window openings in line with and slightly larger than the window openings of the display board. The carrier board having hinged doors, which fit into the window openings and a backer board which holds the doors of the carrier board closed so as to maintain the display item between the door and a frame extension created between the dissimilar sized openings of the display board and the carrier board.
